- c. **No. of header fields: 4**
- d. **Names of fields:**
  - i. **Source Port** (udp.srcport)
  - ii. **Destination** (udp.dstport)
  - iii. **Length** (udp.length)
  - iv. **Checksum** (udp.checksum)

- Each UDP header field is **2 bytes (16 bits)** long. With 4 fields—Source Port, Destination Port, Length, and Checksum—the total UDP header size is **8 bytes**.
- The Length field indicates the total size of the UDP segment (header + payload). In my captured packet, the Length is **1069 bytes**, and the UDP header is **8 bytes**, so the UDP payload is **1069 – 8 = 1061 bytes**, which matches the payload shown in Wireshark.
- The maximum size of a UDP segment is **65,535 bytes**. Subtracting the 8-byte header, the maximum UDP payload is **65,527 bytes**.
- The Source Port field is 16 bits, so the largest possible source port number is **65,535**.
- The **protocol number for UDP** is **17** in decimal notation.

- In my trace file, the **first UDP packet is Packet Number 197**, and the **second UDP packet is Packet Number 270**. The **source port (60282)** of the first packet is the **destination port** of the second packet, and the **destination port (443)** of the first packet is the **source port** of the second packet, which shows the reply relationship between the two packets.
